

Familial Hypercholesterolaemia (FH) Guide – SystmOne (S1)

- How do I access and run the FH search?
 - Firstly you'll need to join the DCS Organisational Group from within S1 (you will need to have System Administrator access rights within your organisation/practice in order to do this):

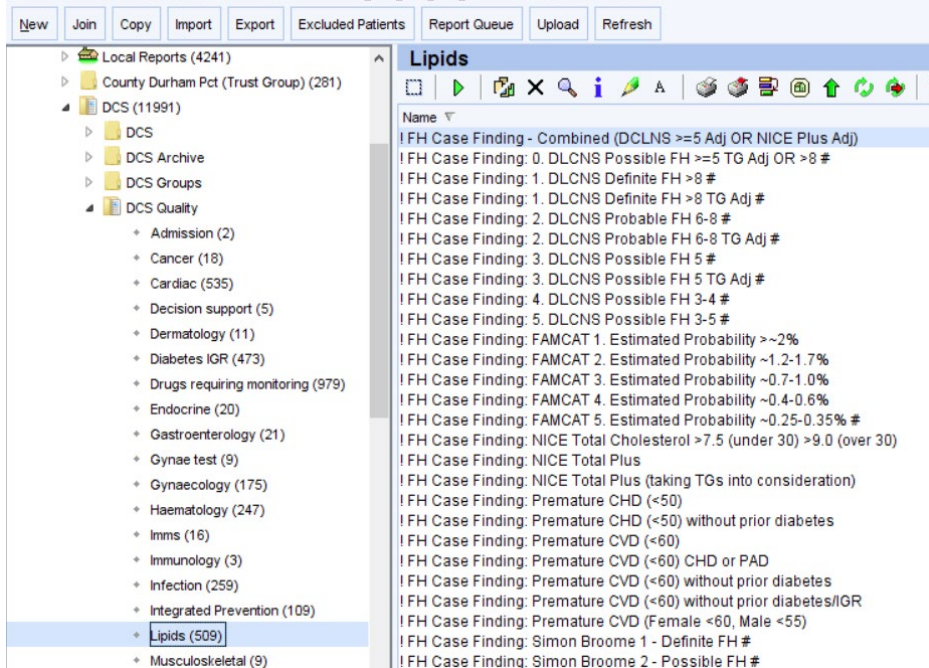

- (Please also join the 'DCS New Word Letter' group too – this will just ensure that you have the most up-to-date letters)
- Your request to join the group will need to be accepted; once this is done you will have access to all the resources.

- To locate the search, navigate to the **clinical reporting** unit:

- Then, navigate to the **Lipids** section within DCS Quality folder of the main DCS group:

- The search to be used for the FH programme is as follows:

- **! FH Case Finding - Combined (DCLNS >=5 Adj OR NICE Plus Adj)**

- The search can also be quickly located by searching for “! FH Combined” (no quotes)

- Right-click on the search and click “Run”:

- Your results are ready when the icon on the right of the screen in the ‘Flags’ column changes from

- To display the list of patients, Right-click on the search and click ‘Show patients’

- If I join the DCS group, will I share any of my organisation’s data out to anyone else?
 - **No.** Joining the group does not permit any access to any of your organisation’s data (patient or otherwise) to other organisations.
- Can I choose which DCS resources I’d like to be active / inactive?
 - **Yes.** All the elements of the DCS group are optional.
 - **NB By default: Patient Status Alerts and a proportion of Protocols are set to be auto-activated when you join the DCS group. These can be turned off if required:**

- **To turn off Patient Status Alerts** (these are the small icons which appear under the patient demographics):
 - Navigate to the PSA management area and untick the ‘enabled’ box for the PSAs that you do not want to use:
